Exam Project – Requirements

Minimum Technical Requirements

Django Web Application

Dynamic, database-driven (SQLite is fine)

Models: 5–6 related models (e.g., pirates, bounties, crews, battles)

CRUD operations on main objects (Create, Read, Update, Delete)

User interaction that modifies the database:

- Select/view single or grouped objects

- Vote, modify, or insert objects via forms

- Display results or rankings

Data Import (at least one)

- Via Django Forms (user fills form to insert data)

- Via CSV file upload (parse and insert into DB)

Template Inheritance

- `base.html` with at least 3 blocks:

 - `header` (top)

 - `content` (main)

 - `footer` (bottom)

- All pages extend `base.html`

What I Expect – Beyond the Checklist

Make it meaningful!

Don't just copy the classroom blog – **create something you care about.**

Use your passions: anime, sports, movies, games, music, art, technology, etc.

Examples (just for inspiration):

One Piece: Platform for the Navy to manage pirate bounties, crews, and wanted posters

Jujutsu Kaisen: Manage the Culling Game – players, points, domains, battles

Film buff: Cinematic universe database – movies, characters, directors, ratings

Sports fan: League manager – teams, matches, player stats, rankings

The project must be fully functional, with a sensible interface and clear purpose.

An example project will be shared on the course repository (Moodle link).
